

ArmaanBot - Rule Based Chatbot Project Report

Project Overview

ArmaanBot is a simple rule-based chatbot developed in Python. It responds to user messages using predefined if-else conditions. The project demonstrates basic chatbot logic and conversation flow without using AI or machine learning.

Objective

To build a beginner-friendly chatbot that interacts with users, answers common questions, and helps understand Python programming concepts such as loops, conditional statements, string handling, and user input.

Project Explanation

The chatbot continuously accepts user input using a while loop. The entered message is converted to lowercase using `lower()` so matching becomes easier. The program checks the message against predefined conditions. If a matching rule is found, the chatbot prints the related response. The chat ends when the user types 'exit' or 'bye'.

Features

- Greets users
- Answers questions about Python, college and internship
- Introduces itself
- Displays current date and time
- Provides help command
- Thanks the user
- Exits safely using 'exit' or 'bye'

Technologies Used

Programming Language: Python 3

IDE: Visual Studio Code

Concepts: if-else statements, while loop, input/output, string functions, datetime module.

How to Run

1. Install Python.
2. Open the project in VS Code.
3. Save the code as `app.py`.
4. Run: `python app.py`
5. Chat with ArmaanBot.

Conclusion

This project helped in understanding the basics of chatbot development, rule-based responses, user interaction, and Python programming. It is a good beginner-level internship project.
